

**Application of Big Data for Transport
Planning and Practices: Case Study
on (i) GPS Log for Traffic Modeling and
(ii) Bus Probe Data for Improved Traffic
Control in Phnom Penh**

**Kiminari Takahashi
International Development Center of Japan
JICA Expert for PPTMTC**

1. Conventional traffic survey data vs “Big Data”

1.1 Conventional traffic survey for transport planning and practices

1.2 Limitation of conventional traffic survey for transport planning and practices

- Small sample, assumed to represent 'average day of neutral month'
- Expensive but quality not always good
- Increasing resistance to answer questionnaire, omission or simplification of journeys
- Variable data quality: errors, sampling bias
- Donor driven which makes difficult to maintain by local cities in recipient developing countries
- Rapid growth and innovation in developing countries requires speedy and timely baseline data for transport planning and implication

1.3 Potential “big data” applied for transport planning and practices

Mobile station data: Door-to-door trips, high sample rate, high representativity

Smart cards: Stop-to-stop trips mostly by public transport

Mobile GPS log: Door-to-door trips, App dependent and bias → *Transport modeling in Phnom Penh*

Vehicle GPS probe data: Road network speed
→ *Improved traffic control in Phnom Penh*

Wifi and Bluetooth: Local OD pattern

1.4 Limitation of big data in case of mobile data

- They do not provide key data for transport planning
 - Lack of personal and family attribute
- App dependent and data bias
 - Unable to identify apps
 - Single GPS log and over 1000 logs in one ID
- Insufficient spatial resolution (network) and discontinuities in the data (apps)
 - Difficult in identifying transport mode

→ Algorithms for data cleaning, sample selection, analysis, data fusion and sample expansion are vital for transport planning and practices

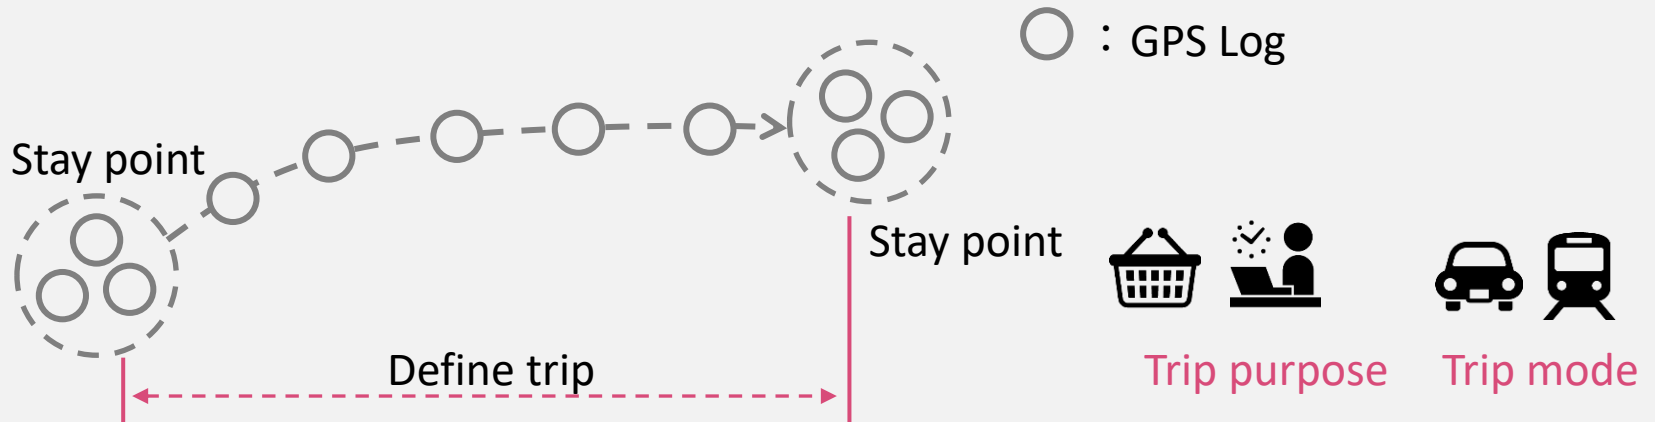

2. GPS Log data for transport planning in Phnom Penh

Research by Kai Kusunose and Prof. Kuniaki Sasaki

2.1 Objectives of research

- 1 Use mobile GPS log data to extract trips, estimate trip purpose and trip mode.

- 2 Examine whether estimation using mobile GPS log data be a substitute for conventional person-trip surveys.

2.2 Features of Mobile GPS log data

Mobile GPS log data purchased from private log data suppliers (i.e., Lifesight and Quadrant)

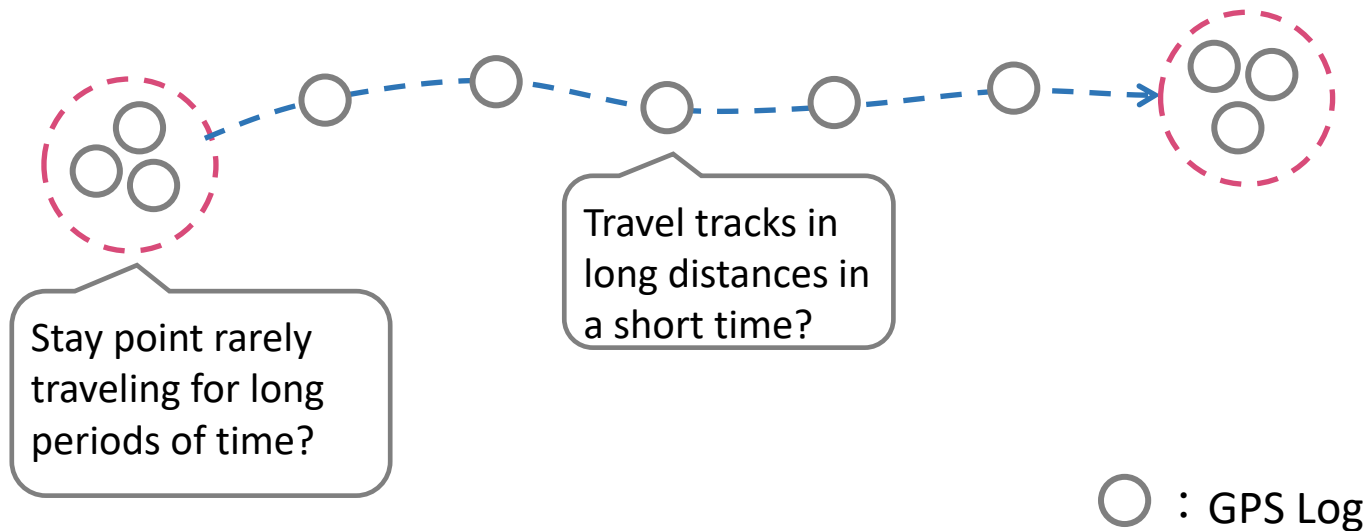

2.3 Definition of 'Stay Point'

【Features of GPS log data】

A sequence of points with time and location information without trip attribute information.

▶ **Necessary to define trip from the relationship between the acquisition time difference and distance/location between plots.**

2.3 Definition of 'Stay Point'

Stay Point (SP) defined as group of plots that remain within a certain range for more than a certain amount of time

- ① Stay more than 5 minutes
Within 50 meter range

- ② Stay more than 15 minutes
Within 100 meter range

2.4 Data cleaning and trip identification

Following cleaning procedures performed on the extracted SPs.

① Exclude the plot where SPs are split by miss plot

Combine split SPs where a single miss plot which does not meet conditions causes SP to break off

② Exclude SPs that were falsely detected near the target zone boundary

Data outside the Phnom Penh area is removed, so SPs are incorrectly detected near the boundary.

As a result, a total of 1506,670 trips were extracted from 45,176 IDs
(Average of 33.35 trips per ID)

2.5 Trip and data analysis classification

	Trip classification	Data analysis			Trip	
		OD	Trip Purpose	Trip mode	Nos	%
A	Both ends with SPs with clear departure and arrival time and detailed plot intervals	○	○	○	105,785	7.0
B	Both ends with SPs with clear departure and arrival time but scattered plot intervals	○	○	△	30,264	2.0
C	Both ends with SPs without clear departure and arrival time with detailed plot intervals	○	○	△	432,772	28.6
D	Both ends with SPs without clear departure and arrival time and with scattered plot intervals	○	○	△	118,105	7.8
E	Both ends with SPs without any plot interval within 2 hours trip range	○	○	×	364,115	24.0
F	Both ends with SPs without any plot interval over 2 hours trip range	○	○	×	32,002	2.1
G	Trips crossing boundary with detailed plot intervals	○	×	×	17,891	1.2
H	Trips crossing boundary without detailed plot intervals	○	×	×	76,765	5.1
I	Unclear SPs with detailed plot intervals	△	×	×	74,781	4.9
J	Unclear SPs with scattered plot intervals	△	×	×	254,190	16.8
K	A group of plots which cannot be defined as trip	×	×	×	7.666	13 0.5

2.6 Data fusion (with POI)

POI (Point of Interest) A specific point on a map; a GIS object treated as a POI, with its name and attributes added to the location information

POI downloaded from Open Street Map (OSM), available free of charge and used almost universally

Point data of Café in Phnom Penh

Polygon data of schools in Phnom Penh

2.6 Data fusion (with POI)

An algorithm developed to estimate the location of SPs based on the distance to SPs.

Stay point at 3 AM

Tied to the nearest POI within 50m

some POIs excluded or set time constraints

11 POIs

Others

2.7 Data analysis (Trip purpose)

Comparison of trip purpose by Mobile GPS log and 2012 PT Survey

Purpose	Mobile GPS Log		2012 Person Trip Survey	
	No of trips	Share [%]	No of trips	Share [%]
To home	573,033	52.78	2,111,944	49.17
To work	171,996	15.84	850,387	19.80
To school	28,764	2.65	620,414	14.45
To business	208,159	19.17	224,442	5.23
To private	63,688	5.87	303,500	9.16
Other	30,970	3.68	94,024	2.19

Distortion observed between Mobile GPS Log and PT survey:

- **To school:** School kids prone not yet obtain Smart Phone or prohibited to bring Phone or switch off at school
- **To business:** PT survey hardly captures business trips due to omission and/or simplification of respondents journeys. Improved accuracy and substitute business trip survey by Mobile GPS log data

3. Bus probe data for improved traffic control in Phnom Penh Pilot bus priority signal under JICA PiBO

3.1 JICA Project for Improvement of Public Bus Operation in Phnom Penh (PiBO)

Overall Goal:

Ridership on the public transport in Phnom Penh is promoted: **70,000 pax per day by 2025 (6,000 pax per day in 2016)**

Project Purpose:

Bus operation management capacity in Phnom Penh is improved.

Output:

1. Improved **bus operation capacity**
2. Improved **maintenance and inspection capacity**
3. **Training of bus drivers**
4. Improved **business management capacity**
5. Improved policy planning for **public transport priority measures**

Project Duration:

January 2017 to August 2022 **including 20-month suspension (March 2020 to Oct 2021)**

3.2 Pilot Bus Priority Signal under JICA PiBO

Purpose of the Pilot Bus Priority Signal:

- (1) To verify application of bus probe data for justifying and improving signal control parameter and for monitoring improved parameters performance
- (2) To confirm reduction in travel time of bus route subject to priority control along Line 4A and 4B) and contribution to on-schedule operation of City Bus

Comparison with/without Pilot Bus Priority Signal

Pilot Bus Priority Signal Result and Recommendation

Result and Recommendation:

- (1) Bus probe data essential for improving signal control parameter and DPWT/TCC officers can grasp real-time information for traffic condition (under constraints of insufficient detector data)
- (2) City Bus operation improved under slim control parameter changes which significantly contributes to on-schedule operation. Impacts on crossing traffic be also monitored by Bus probe data and adjusted to minimize the adverse impact

4. Wrap up

Wrap up

- Two case studies reveal potential and effective usage of 'Big Data' in transport planning and practices in Cambodia
- In case of mobile GPS log, algorithms for data cleaning, analysis, data fusion and sample expansion are vital and which may require further studies.
- Note that privacy policy of mobile OS tends to affect availability of mobile GPS log
- Taking Bus probe data as real-time 'Big Data' as an example, the bus priority signal tested as pilot
- It proved potential use of Bus probe data for optimization of traffic control signal, which requires organizational coordination
